Q: Hadoop & Pig: How to use Key-Value Store for reading on PigLatin For one of my MapReduce jobs, I've need to read from a Key-Value Store (in this case, Cassandra). Does Hadoop have a built-in support for reading from a Key-Value Store? Or do I need to use a custom InputFormat implementation that reads data from a Key-Value Store? The reason I am asking this is because the input data in this case looks a bit "unstructured". For example, there is no line like "key = value", instead, it's something like "key = {"value": "value"}" (I am not using a key-value store for writing data to, but only for reading. The data is encoded in Pig Latin and do not need to be modified during the MapReduce.) A: Looks like this is not available out of the box, but you can write your own custom InputFormat that reads the data from Cassandra. The InputFormat interface has 2 methods: nextKeyValue() and getCurrentKey(). Look at this article for an example.

Mood "Keep it playful" We like to do the rhythmic thing, while using joyful and passionate colors. Inspiration We want to capture a light and elegant mood with a mixture of black and white, while using retro colors. About the website The website shows an open space where you can go back and forth, because it isn't static. In each card there are info about the project and a video of the real live event in order to show you the whole project. Each event starts with "Hello/Hi" and ends with "Bye Bye/Goodbye". This makes each event personal, with some musical guitar in the middle.

The zebrafish, *Danio rerio*, is a model organism of choice for many developmental biologists because of its small size, transparency, amenability to genetic and chemical manipulations, amenability to high-throughput imaging, and conservation of gene function across vertebrates. To fully utilize the advantages of the zebrafish, there is a need to develop chemical genetics. In

Keymacro is a handy text-macro editor, with pre-defined key-mappings and text replacements that can be used for coding and scripting. Keymacro is highly customizable and supports text-files, spreadsheets and hypertext files. Keymacro can be used as a stand-alone editor or as a project-based editor, with built-in support for making real-time updates to a spreadsheet or a text file. Keymacro can display character and symbol codes, numerical codes and can be configured to display other available codes, such as hex, decimal, octal, and binary. Additionally, you can select to highlight lines, and toggle text-wrapping. Keymacro also features a code-completion feature for up to 20 possible values. The possible completions are displayed above a code, and you can add custom completions as you need them. Keymacro can be used for coding in a variety of languages, including HTML, Visual Basic and PHP. Additionally, you can create your own macros and publish them in Keymacro's web-interface for your fellow programmers and other users to use. Keymacro is a great alternative to Notepad++, as it is more feature-rich than the former, yet less complex than the latter. Keymacro can also be used to create, publish, and share your own scripts, as it features all the necessary scripting tools. Keymacro is a cross-platform application that runs on Windows, Linux, and Mac OS X.
